Using the
Lawley Syringe

MINTER
HORMONE HEALTH

To successfully measure the cream (without having it go everywhere) patients must:

1. Unscrew the cap on the tube and remove the metal foil seal.

2. **Gently** squeeze the tube so the cream comes to the opening aperture, but not out of the tube.

3. Insert the syringe measure fully into the opened nozzle. The tip of the tube should now be in cream. There should be a snug fit between the opening of the tube and the tip of the syringe.

4. Invert the tube with syring still in the nozzle so gravity plays its part.

5. Then **slowly withdraw the plunger so suction draws the cream into the barrel of the syringe.** If there is any resistance to filling, then **gently** squeeze to assist flow.

   This is the step where you can go wrong. One might expect the squeezing to get the cream to flow, however it is the suction of the plunger that does it. Please make sure you follow the steps in the right order.

6. If there are any air bubbles, overfill past the required mark then depress the plunger back to the prescribed dose and the cream will easily go back into the tube.

7. Separate the syringe and tube and reseal tube with cap.
